

MSA – Safety Management System Workshop Overview

Specific Learning:

Learners will be taken on a step by step journey through the development, implementation and operation of a safety management system. It begins with the policies and continues through the intricate steps of each element. Samples of numerous documents are presented and worked through in order to provide the learners with hands on experience. Real world examples are presented and learners are encouraged to discuss how each element of the SMS can be applied in their workplace.

Reasoning:

A safety management system (SMS) should be integrated into every organization. Lack of safety planning normally increases an organization's costs significantly. Modern management principles indicate that overall business management can be judged and assessed based on the organization's safety management system.

Goal:

This workshop will provide learners with the ability to develop and operate a safety management system for an organization of any size. Application of the knowledge gained during the workshop will ensure that the learners can develop a SMS that can prove due diligence above and beyond the legal requirements. Upon successful completion of this workshop a certificate will be mailed to the learner.

Duration and Materials:

The workshop includes 1 day of theory where the learners will participate as a group. Learners will receive a manual as well as samples of policies, procedures and forms for each of the separate elements within the SMS. All materials are provided both in hard and electronic copy.

Target Audience:

This workshop is designed for safety coordinators and middle to upper management.
